

Crested Iris

Iris cristata

Plant Height: 4 inches

Flower Height: 6 inches

Spread: 6 inches

Sunlight: ● ●

Hardiness Zone: 3b

Other Names: Dwarf Crested Iris

Group/Class: Native

Ornamental Features

Crested Iris has masses of beautiful lavender flag-like flowers with powder blue overtones, white throats and a yellow beard at the ends of the stems in mid spring, which are most effective when planted in groupings. Its sword-like leaves remain green in color throughout the season.

Landscape Attributes

Crested Iris is an herbaceous perennial with an upright spreading habit of growth. Its relatively fine texture sets it apart from other garden plants with less refined foliage.

This plant will require occasional maintenance and upkeep, and should be cut back in late fall in preparation for winter. Deer don't particularly care for this plant and will usually leave it alone in favor of tastier treats.

Gardeners should be aware of the following characteristic(s) that may warrant special consideration;

- Spreading
- Insects

Crested Iris is recommended for the following landscape applications;

Planting & Growing

Crested Iris will grow to be only 4 inches tall at maturity extending to 6 inches tall with the flowers, with a spread of 6 inches. Its foliage tends to remain low and dense right to the ground. It grows at a medium rate, and under ideal conditions can be expected to live for approximately 10 years. As an herbaceous perennial, this plant will usually die back to the crown each winter, and will regrow from the base each spring. Be careful not to disturb the crown in late winter when it may not be readily seen!

This plant does best in partial shade to shade. It requires an evenly moist well-drained soil for optimal growth, but will die in standing water. It is not particular as to soil type or pH. It is somewhat tolerant of urban pollution. This species is native to parts of North America. It can be propagated by division.
